Anatomy and Histology of the Laboratory Rat in Toxicology and Biomedical Research presents the detailed systematic anatomy of the rat with a focus on toxicological needs Most large works dealing with the laboratory rat provide a chapter on anatomy but fall far short of the detailed account in this book which also focuses on the needs of toxicologists and others who use the rat as a laboratory animal The book includes detailed guides on dissection methods and the location of specific tissues in specific organ systems Crucially the book includes classic illustrations from Miss H G Q Rowett along with new color photo micrographs Written by two of the top authors in their fields this book can be used as a reference guide and teaching aid for students and researchers in toxicology In addition veterinary medical students researchers who utilize animals in biomedical research and researchers in zoology comparative anatomy physiology and pharmacology will find this book to be a great resource Illustrated with over a hundred black and white and color images to assist understanding Contains detailed descriptions and explanations to accompany all images helping with self study Designed for toxicologic research for people from diverse backgrounds including biochemistry pharmacology physiology immunology and general biomedical sciences

Skeletal Muscle Circulation Ronald J. Korthuis, 2011 The aim of this treatise is to summarize the current understanding of the mechanisms for blood flow control to skeletal muscle under resting conditions how perfusion is elevated exercise hyperemia to meet the increased demand for oxygen and other substrates during exercise mechanisms underlying the beneficial effects of regular physical activity on cardiovascular health the regulation of transcapillary fluid filtration and protein flux across the microvascular exchange vessels and the role of changes in the skeletal muscle circulation in pathologic states Skeletal muscle is unique among organs in that its blood flow can change over a remarkably large range Compared to blood flow at rest muscle blood flow can increase by more than 20 fold on average during intense exercise while perfusion of certain individual white muscles or portions of those muscles can increase by as much as 80 fold This is compared to maximal increases of 4 to 6 fold in the coronary circulation during exercise These increases in muscle perfusion are required to meet the enormous demands for oxygen and nutrients by the active muscles Because of its large mass and the fact that skeletal muscles receive 25% of the cardiac output at rest sympathetically mediated vasoconstriction in vessels supplying this tissue allows central hemodynamic variables e g blood pressure to be spared during stresses such as hypovolemic shock Sympathetic vasoconstriction in skeletal muscle in such pathologic conditions also effectively shunts blood flow away from muscles to tissues that are more sensitive to reductions in their blood supply that might otherwise occur Again because of its large mass and percentage of cardiac output directed to skeletal muscle alterations in blood vessel structure and function with chronic disease e g hypertension contribute significantly to the pathology of such disorders Alterations in skeletal muscle vascular resistance and or in the exchange properties of this vascular bed also modify transcapillary fluid filtration and solute movement across the microvascular barrier to influence muscle function and contribute to disease pathology Finally it is clear that exercise training induces an adaptive transformation to a protected phenotype in the vasculature supplying skeletal muscle and other tissues to promote overall cardiovascular health

Stretch Intensity and the Inflammatory Response: A Paradigm Shift Nikos C. Apostolopoulos, 2018-12-27 In this manuscript practitioners and students who are concerned with sports and rehabilitation medicine kinesiology as well as coaches and athletes are introduced to numerous concepts including mechanotransduction inflammation pro and anti inflammatory cytokines calpains the extracellular matrix neutrophils and macrophages and their relevance to stretching particularly stretching intensity Although the quantitative parameters of training duration and frequency are important it is the qualitative criterion of intensity how much that the author suggests is ultimately of greater concern Intensity the rate and magnitude of force may be responsible for the proper recovery regeneration and adaptation of the musculoskeletal tissues from training competition or rehabilitation from injuries Research suggests that too much force results in the stimulation of an inflammatory response one associated with a biochemical feedback emerging from a mechanical stimulus The intent of this manuscript is twofold to initiate the discussion of the importance of stretching intensity with regard to proper recovery regeneration and adaptation and to suggest that researchers need to explore its potential role in addressing numerous inflammatory RA and non inflammatory OA recurrent tendinitis etc musculoskeletal conditions as well
